

# Package ‘Rphylip’

December 16, 2013

**Version** 0.1-10

**Date** 2013-12-16

**Title** Rphylip: An R interface for PHYLIP

**Author** Liam J. Revell

**Maintainer** Liam J. Revell <liam.revell@umb.edu>

**Depends** R (>= 2.10), ape (>= 3.0-10)

**ZipData** no

**Description** Rphylip provides an R interface for the PHYLIP package. All users of Rphylip will thus first have to install the PHYLIP phylogeny methods program package (Felsenstein 2013). See <http://evolution.genetics.washington.edu/phylip.html> for more information about installing PHYLIP.

**License** GPL (>= 2)

**URL** <http://www.phytools.org/Rphylip>

**Repository**

**Date/Publication** 2013-12-16 12:00:00 EDT

Rphylip-package	<i>Rphylip: An R interface for PHYLIP</i>
-----------------	---

---

**Description**

**Rphylip** provides an R interface for programs in the PHYLIP phylogeny methods package (Felsenstein 1989, 2013).

**Details**

The complete list of functions can be displayed with `library(help = Rphylip)`. Obviously, before any of the functions of this package can be used, users must first install PHYLIP (Felsenstein 2013). More information about installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>. More information on **Rphylip** can be found at <http://www.phytools.org/Rphylip/> or <http://blog.phytools.org>. The latest code for the development version of Rphylip can also be found on github at the following URL: <http://github.com/liamrevell/Rphylip>.

---

as.proseq	<i>Converts objects to protein sequences</i>
-----------	--

---

**Description**

Converts objects to class "proseq".

**Usage**

`as.proseq(x, ...)`

**Arguments**

`x` an object containing amino sequences. (Presently only objects of class "phyDat" are permitted.)

`...` optional arguments.

**Value**

An object of class "proseq" containing protein sequences.

**Author(s)**

Liam Revell <liam.revell@umb.edu>

**See Also**

`print.proseq`, `Rproml`

---

opt.Rdnaml

*Parameter optimizer for Rdnaml*

---

**Description**

This function is an wrapper for `Rdnaml` that attempts to optimize `gamma` (the alpha shape parameter of the gamma model of rate heterogeneity among sites), `kappa` (the transition:transversion ratio), and `bf` (the base frequencies).

**Usage**

```
opt.Rdnaml(X, path=NULL, ...)
```

**Arguments**

`X` an object of class "DNABin".

`path` path to the executable containing `dnaml`. If `path = NULL`, the R will search several commonly used directories for the correct executable file.

`...` optional arguments. See details for more information.

**Details**

Optional arguments include the following: `tree` fixed tree to use in optimization - if not provided, it will be estimated using `Rdnaml` under the default conditions; `bounds` a list with bounds for optimization - for `kappa` and `gamma` this should be a two-element vector, whereas for `bf` this should be a 4 x 2 matrix with lower bounds in column 1 and upper bounds in column 2.

More information about the `dnaml` program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/dnaml.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

**Value**

This function returns a list with the following components: kappa, gamma, bf (see Details), and logLik (the log-likelihood of the fitted model).

Rdnaml

**Examples**

```
## Not run:
data(primates)
fit<-opt.Rdnaml(primates,bounds=list(kappa=c(0.1,40))
tree<-Rdnaml(primates,kappa=fit$kappa,gamma=fit$gamma,bf=fit$bf)

## End(Not run)
```

---

primates

*Example datasets*

---

**Description**

primates is an object of class "DNAbin" containing nucleotide sequence data of mysterious origin for 12 species of primates. chloroplast is an object of class "proseq" containing a chloroplast alignment from the phangorn package (Schliep 2011).

**Usage**

```
data(primates)
data(chloroplast)
```

**Format**

The data are stored as an object of class "DNAbin" or "proseq".

**Source**

Unknown.

---

print.proseq	<i>Print method protein sequences</i>
--------------	---------------------------------------

---

**Description**

Print method for an object of class "proseq".

**Usage**

```
## S3 method for class 'proseq'
print(x, printlen=6, digits=3, ...)
```

**Arguments**

x	an object of class "proseq".
printlen	number of sequence names to print.
digits	number of digits to print.
...	optional arguments.

**Value**

Prints to screen.

---

Rconsense	<i>R interface for consense</i>
-----------	---------------------------------

---

**Description**

This function is an R interface for consense in the PHYLIP package (Felsenstein 2013). consense can be used to compute the consensus tree from a set of phylogenies.

**Usage**

```
Rconsense(trees, path=NULL, ...)
```

**Arguments**

trees	an object of class "multiPhylo".
path	path to the directory containing the executable consense. If path = NULL, the R will search several commonly used directories for the correct executable file.
...	optional arguments to be passed to consense. See details for more information.

## Details

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `method` which can be "extended" (extended majority rule consensus, the default), "strict" (strict consensus), or regular majority rule consensus ("majority"); `"outgroup"` single taxon label or vector of taxa that should be used to root all trees before analysis; `rooted` logical value indicated whether to treat the input trees as rooted (defaults to `rooted = FALSE`); and `cleanup` remove PHYLIP input & output files after the analysis is completed (defaults to `cleanup = TRUE`).

More information about the consense program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/consense.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

## Value

This function returns an object of class "phylo". For methods other than `method = "strict"`, `tree$node.label` contains the proportion of phylogenies in `trees` containing that subtree.

## Examples

```
## Not run:
trees<-rmtree(n=10,N=10)
tree<-Rconsense(trees)

## End(Not run)
```

---

Rcontml

*R interface for contml*

---

## Description

This function is an R interface for `contml` in the PHYLIP package (Felsenstein 2013). `contml` can be used for ML phylogeny estimation from gene frequency data or continuous characters. The continuous characters should be rotated so as to be uncorrelated before analysis.

## Usage

```
Rcontml(X, path=NULL, ...)
```

## Arguments

<code>x</code>	either (a) a <i>matrix</i> of continuous valued traits (in columns) with rownames containing species names; or (b) a list of matrices in which each row contains the relative frequency of alleles at a locus for a species. In the latter case the rownames of each matrix in the list should contain the species names.
<code>path</code>	path to the executable containing contml. If <code>path = NULL</code> , the R will search several commonly used directories for the correct executable file.
<code>...</code>	optional arguments to be passed to contml. See details for more information.

## Details

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `tree` object of class "phylo" - if supplied, then the model will be optimized on a fixed input topology; `global` perform global search (defaults to `global = TRUE`); `random.order` add taxa to tree in random order (defaults to `random.order = TRUE`); `random.addition` number of random addition replicates for `random.order = TRUE` (defaults to `random.addition = 10`); `outgroup` outgroup if outgroup rooting of the estimated tree is desired; and `cleanup` remove PHYLIP input/output files after the analysis is completed (defaults to `cleanup = TRUE`).

More information about the contml program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/contml.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

## Value

This function returns an object of class "phylo" that is the optimized tree.

## Author(s)

## See Also

`Rdnaml`, `Rproml`

---

Rcontrast

*R interface for contrast*

---

## Description

This function is an R interface for contrast in the PHYLIP package (Felsenstein 2013). contrast can be used to perform the among species phylogenetically independent contrasts method of Felsenstein (1985) and the within & among species method of Felsenstein (2008).

More information about the contrast program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/contrast.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

## Usage

```
Rcontrast(tree, X, path=NULL, ...)
```

## Arguments

tree	object of class "phylo".
X	a <i>matrix</i> of continuous valued traits (in columns) with rownames containing species names. For one trait, X can be a matrix with one column or a vector with names (X) containing species names matching <code>tree\$tip.label</code> . For within-species contrasts analysis, the matrix should contain repeating (identical) row names for conspecifics.
path	path to the executable containing contrast. If <code>path = NULL</code> , the R will search several commonly used directories for the correct executable file.
...	optional arguments to be passed to contrast. See details for more information.

## Details

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); and `cleanup` remove PHYLIP input/output files after the analysis is completed (defaults to `cleanup = TRUE`).

## Value

If X contains one observation per species (say, the species mean), then `Rcontrast` returns a list with the following components: `Contrasts`, a matrix with all phylogenetically independent contrasts; `Covariance_matrix`, a matrix containing the evolutionary variances (on diagonals) and covariances; `Regressions`, a matrix containing the pair-wise bivariate regression coefficients (columns on rows); `Correlations`, a correlation matrix of contrasts.

If X contains more than one sample per species, then `Rcontrast` returns a list with the following elements: `VarA`, the estimated among-species variance-covariance matrix; `VarE`, the estimated within-species (i.e., 'environmental') variance-covariance matrix; `VarA.Regression`, a matrix containing the pair-wise bivariate among-species regression coefficients (columns on rows); `VarA.Correlations`, a matrix with the among-species evolutionary correlations; `VarE.Regressions`, the pair-wise bivariate within-species regression coefficients; `VarE.Correlations`, the within-species correlations; `nonVa.VarE`, `nonVa.VarE.Regressions`, and `nonVa.VarA.Correlations`,

estimates obtained when `VarA` is not included in the model; `logLik` and `nonVa.logLik`, log-likelihood when `VarA` is included (or not) in the model; `k` and `nonVa.k` the number of parameters estimated in each model; and `P` the p-value of a likelihood-ratio test of `VarA`, in which  $df = k - nonVa.k$ .

Rdnadist

*R interfaces for dnadist*

---

### Description

This function is an R interface for `dnadist` in the PHYLIP package (Felsenstein 2013). `dnadist` can be used to estimate the evolutionary distances between DNA sequences under various models.

### Usage

```
Rdnadist(X, method=c("F84", "K80", "JC", "LogDet"), path=NULL, ...)
```

### Arguments

- |                     |   |
|---------------------|---|
| <code>X</code>      | an object of class "DNABin".  |
| <code>method</code> | method for calculating the distances. Can be "F84" (Kishino & Hasegawa 1989; Felsenstein & Churchill 1996), "K80" (Kimura 1980), "JC" (Jukes & Cantor 1969), or "LogDet" (Barry & Hartigan 1987; Lake 1994; Steel 1994; Lockhart et. al. 1994). Also <code>method="similarity"</code> computes the sequence similarity among the rows of <code>X</code> . |
| <code>path</code>   | path to the executable containing <code>dnadist</code> . If <code>path = NULL</code> , the R will search several commonly used directories for the correct executable file.   |
| <code>...</code>    | optional arguments to be passed to <code>dnadist</code> . See details for more information.   |

## Details

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `gamma` alpha shape parameter of a gamma model of rate heterogeneity among sites (defaults to no gamma rate heterogeneity); `kappa` transition:transversion ratio (defaults to `kappa = 2.0`); `rates` vector of rates (defaults to single rate); `rate.categories` vector of rate categories corresponding to the order of `rates`; `weights` vector of weights of length equal to the number of columns in `X` (defaults to unweighted); `bf` vector of base frequencies in alphabetical order (i.e., A, C, G, & T) - if not provided, then defaults to empirical frequencies; and `cleanup` remove PHYLIP input & output files after the analysis is completed (defaults to `cleanup = TRUE`).

More information about the `dnadist` program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/dnadist.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

## Value

This function returns an object of class `"dist"`.

Rdnaml

*R interfaces for dnaml and dnamlk*

## Description

This function is an R interface for dnaml in the PHYLIP package (Felsenstein 2013). dnaml can be used for ML phylogeny estimation from DNA sequences (Felsenstein 1981; Felsenstein & Churchill 1996).

## Usage

```
Rdnaml(X, path=NULL, ...)
Rdnamlk(X, path=NULL, ...)
```

## Arguments

<code>X</code>	an object of class "DNAbin".
<code>path</code>	path to the executable containing dnaml. If <code>path = NULL</code> , the R will search several commonly used directories for the correct executable file.
<code>...</code>	optional arguments to be passed to dnaml or dnamlk. See details for more information.

## Details

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `tree` object of class "phylo" - if supplied, then the model will be optimized on a fixed input topology; `kappa` transition:transversion ratio (defaults to `kappa = 2.0`); `bf` vector of base frequencies in alphabetical order (i.e., A, C, G, & T) - if not provided, then defaults to empirical frequencies; `rates` vector of rates (defaults to single rate); `rate.categories` vector of rate categories corresponding to the order of `rates`; `gamma` alpha shape parameter of a gamma model of rate heterogeneity among sites (defaults to no gamma rate heterogeneity); `ncat` number of rate categories for the gamma model; `inv` proportion of invariant sites for the invariant sites model (defaults to `inv = 0`); `weights` vector of weights of length equal to the number of columns in `X` (defaults to unweighted); `speedier` speedier but rougher analysis (defaults to `speedier = FALSE`); `global` perform global search (defaults to `global = TRUE`); `random.order` add taxa to tree in random order (defaults to `random.order = TRUE`); `random.addition` number of random addition replicates for `random.order = TRUE` (defaults to `random.addition = 10`); `outgroup` outgroup if outgroup rooting of the estimated tree is desired; and `cleanup` remove PHYLIP input & output files after the analysis is completed (defaults to `cleanup = TRUE`).

Finally `clock=TRUE` enforces a molecular clock. The argument `clock` is only available for `Rdnaml`. If `clock=TRUE` then `dnamlk` is used internally. For `Rdnamlk` a molecular clock is assumed, thus `Rdnaml(..., clock=TRUE)` and `Rdnamlk(...)` are equivalent.

More information about the `dnaml` and `dnamlk` programs in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/dnaml.html>, and here <http://evolution.genetics.washington.edu/phylip/doc/dnamlk.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

## Value

This function returns an object of class "phylo" that is the optimized tree.

```

---

Rdnapars

*R interface for dnapars*

---

## Description

This function is an R interface for `dnapars` in the PHYLIP package (Felsenstein 2013). `dnapars` can be used for MP phylogeny estimation from DNA sequences (Eck & Dayhoff 1966; Kluge & Farris 1969; Fitch 1971).

## Usage

```
Rdnapars(X, path=NULL, ...)
```

## Arguments

<code>x</code>	an object of class "DNABin".
<code>path</code>	path to the executable containing dnapars. If <code>path = NULL</code> , the R will search several commonly used directories for the correct executable file.
<code>...</code>	optional arguments to be passed to dnapars. See details for more information.

## Details

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `tree` object of class "phylo" - if supplied, then the parsimony score will be computed on a fixed input topology; `thorough` logical value indicating whether to conduct a more thorough search (defaults to `thorough=TRUE`); `nsave` number of trees to save if multiple equally parsimonious trees are found (defaults to `nsave=10000`); `random.order` add taxa to tree in random order (defaults to `random.order = TRUE`); `random.addition` number of random addition replicates for `random.order = TRUE` (defaults to `random.addition = 10`); `threshold` threshold value for threshold parsimony (defaults to ordinary parsimony); `transversion` logical value indicating whether to use transversion parsimony (defaults to `transversion=FALSE`); `weights` vector of weights of length equal to the number of columns in `x` (defaults to `unweighted`); `outgroup` outgroup if outgroup rooting of the estimated tree is desired; and `cleanup` remove PHYLIP input & output files after the analysis is completed (defaults to `cleanup = TRUE`).

More information about the dnapars program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/dnapars.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

## Value

This function returns an object of class "phylo" that is the optimized tree.

Rdnapenny

*R interface for dnapenny***Description**

This function is an R interface for dnapenny in the PHYLIP package (Felsenstein 2013). dnapenny performs branch & bound parsimony searching following Hendy & Penny (1982).

**Usage**

```
Rdnapenny(X, path=NULL, ...)
```

**Arguments**

X	an object of class "DNAbin".
path	path to the executable containing dnapenny. If path = NULL, the R will search several commonly used directories for the correct executable file.
...	optional arguments to be passed to dnapenny. See details for more information.

**Details**

Optional arguments include the following: quiet suppress some output to R console (defaults to quiet = FALSE); groups number of groups of 1,000 trees (defaults to groups = 10000); report reporting frequency, in numbers of trees (defaults to report = 1000); simple simple branch & bound (defaults to simple = TRUE); threshold threshold value for threshold parsimony (defaults to ordinary parsimony); weights vector of weights of length equal to the number of columns in X (defaults to unweighted); outgroup outgroup if outgroup rooting of the estimated tree is desired; and cleanup remove PHYLIP input & output files after the analysis is completed (defaults to cleanup = TRUE).

More information about the dnapenny program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/dnapenny.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

**Value**

This function returns an object of class "phylo" or "multiPhylo" that is the tree or trees with the best parsimony score. tree\$score gives the parsimony score, for "phylo" object tree.

read.protein	<i>Reads protein sequences from file in multiple formats</i>
--------------	--

---

## Description

Reads protein sequences from a file.

## Usage

```
read.protein(file, format="fasta", ...)
```

## Arguments

file	file name for file containing protein sequences.
format	format of input file. Permitted formats are "fasta" and "sequential". See read.dna for more information.
...	optional arguments.

## Value

An object of class "proseq" containing protein sequences.

Rneighbor

*R interface for neighbor***Description**

This function is an R interface for neighbor in the PHYLIP package (Felsenstein 2013). neighbor can be used for neighbor-joining (Saitou & Nei 1987) and UPGMA (Sokal & Michener 1958) phylogeny inference.

**Usage**

```
Rneighbor(D, path=NULL, ...)
```

**Arguments**

D	a distance matrix as an object of class "matrix" or "dist". If a matrix, then D should be symmetrical with a diagonal of zeros.
path	path to the executable containing neighbor. If path = NULL, the R will search several commonly used directories for the correct executable file.
...	optional arguments to be passed to neighbor. See details for more information.

**Details**

Optional arguments include the following: quiet suppress some output to R console (defaults to quiet = FALSE); method - can be "NJ" or "nj" (for neighbor-joining), or "UPGMA" or "UPGMA" (for UPGMA); random.order add taxa to tree in random order (defaults to random.order = TRUE); outgroup outgroup if outgroup rooting of the estimated tree is desired (only works for method = "NJ", UPGMA trees are already rooted); and cleanup remove PHYLIP input & output files after the analysis is completed (defaults to cleanup = TRUE).

More information about the neighbor program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/neighbor.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. More information about installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

**Value**

This function returns an object of class "phylo" that is the NJ or UPGMA tree.

Rproml

*R interfaces for proml and promlk*

---

## Description

This function is an R interface for proml in the PHYLIP package (Felsenstein 1989, 2013). proml can be used for ML phylogeny estimation from amino acid sequences.

## Usage

```
Rproml(X, path=NULL, ...)
Rpromlk(X, path=NULL, ...)
```

## Arguments

X	an object of class "proseq".
path	path to the executable containing proml. If path = NULL, the R will search several commonly used directories for the correct executable file.
...	optional arguments to be passed to proml or promlk. See details for more information.

## Details

Optional arguments include the following: quiet suppress some output to R console (defaults to quiet = FALSE); tree object of class "phylo" - if supplied, then the model will be optimized on a fixed input topology; model amino acid model - could be "JTT" (Jones et al. 1992), "PMB" (Veerassamy et al. 2003), or "PAM" (Dayhoff & Eck 1968; Dayhoff et al. 1979; Koisol & Goldman 2005); rates vector of rates (defaults to single rate); rate.categories vector of rate categories corresponding to the order of rates; gamma.alpha shape parameter of a gamma model of rate heterogeneity among sites (defaults to no gamma rate heterogeneity); ncat number of rate categories for the gamma model; inv proportion of invariant sites for the invariant sites model (defaults to inv = 0); weights vector of weights of length equal to the number of columns in X (defaults to unweighted); speedier speedier but rougher analysis (defaults to speedier = FALSE); global perform global search (defaults to global = TRUE); random.order add taxa to tree in random order (defaults to random.order = TRUE); random.addition number of random addition replicates for random.order = TRUE (defaults to random.addition = 10);

outgroup outgroup if outgroup rooting of the estimated tree is desired; and cleanup remove PHYLIP input & output files after the analysis is completed (defaults to cleanup = TRUE).

Finally clock=TRUE enforces a molecular clock. The argument clock is only available for Rproml. If clock=TRUE then promlk is used internally. For Rpromlk a molecular clock is assumed, thus Rproml(..., clock=TRUE) and Rpromlk(...) are equivalent. Note that in PHYLIP 3.695 my tests of promlk yielded peculiar results (all branch lengths zero length, random topology), so I'm not sure what to make of that.

More information about the proml and promlk programs in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/proml.html>, and here <http://evolution.genetics.washington.edu/phylip/doc/promlk.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

### Value

This function returns an object of class "phylo" that is the optimized tree.

Rprotdist

*R interfaces for protdist***Description**

This function is an R interface for `protdist` in the PHYLIP package (Felsenstein 2013). `protdist` can be used to estimate the evolutionary distances between amino acid sequences under various models.

**Usage**

```
Rprotdist(X, path=NULL, ...)
```

**Arguments**

<code>X</code>	an object of class "proseq" containing aligned amino acid sequences.
<code>path</code>	path to the executable containing <code>protdist</code> . If <code>path = NULL</code> , the R will search <code>sev</code> arguments to be passed to <code>protdist</code> . See details for more information.
<code>...</code>	optional arguments to be passed to <code>protdist</code> . See details for more information.

**Details**

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `model` can be "JTT" (Jones et al. 1992), "PMB" (Veerassamy et al. 2003), "PAM" (Dayhoff & Eck 1968; Dayhoff et al. 1979; Koisol & Goldman 2005), "Kimura" (a simple model based on Kimura 1980), "similarity" which gives the similarity between sequences, and "categories" which is due to Felsenstein; `gamma.alpha` shape parameter of a gamma model of rate heterogeneity among sites (defaults to no gamma rate heterogeneity) - note that gamma rate heterogeneity does not apply to `model = "Kimura"` or `model = "similarity"`; `kappa` transition:transversion ratio (defaults to `kappa = 2.0`), `genetic.code`, type of genetic code to assume (options are "universal", the default, "mitochondrial", "vertebrate.mitochondrial", "fly.mitochondrial", and "yeast.mitochondrial"), `categorization`, categorization scheme for amino acids (options are "GHB", the George et al. 1988 classification, "Hall", a classification scheme provided by Ben Hall, and "chemical", a scheme based on Conn & Stumpf 1963); and, finally, `ease`, a numerical parameter that indicates the facility of getting between amino acids of different categories in which 0 is nearly impossible, and 1 is no difficulty (defaults to `ease = 0.457`) - note that `kappa`, `bf`, `genetic.code`, `categorization`, and `ease` apply only to `model = "categories"`; `rates` vector of rates (defaults to single rate); `rate.categories` vector of rate categories corresponding to the order of `rates`; `weights` vector of weights of length equal to the number of columns in `X` (defaults to unweighted); and `cleanup` remove PHYLIP input & output files after the analysis is completed (defaults to `cleanup = TRUE`).

More information about the `protdist` program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/protdist.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

**Value**

This function returns an object of class "dist".

Rprotpars

*R interface for protpars*

---

**Description**

This function is an R interface for protpars in the PHYLIP package (Felsenstein 2013). protpars can be used for MP phylogeny estimation from protein sequences (Eck & Dayhoff 1966; Fitch 1971).

**Usage**

```
Rprotpars(X, path=NULL, ...)
```

**Arguments**

<code>X</code>	an object of class "proseq" containing aligned amino acid sequences.
<code>path</code>	path to the executable containing protpars. If <code>path = NULL</code> , the R will search several commonly used directories for the correct executable file.
<code>...</code>	optional arguments to be passed to protpars. See details for more information.

**Details**

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `tree` object of class "phylo" - if supplied, then the parsimony score will be computed on a fixed input topology; `random.order` add taxa to tree in random order (defaults to `random.order = TRUE`); `random.addition` number of random addition replicates for `random.order = TRUE` (defaults to `random.addition = 10`); `threshold` threshold value for threshold parsimony (defaults to ordinary parsimony); `genetic.code`, type of genetic code to assume (options are "universal", the default, "mitochondrial", "vertebrate.mitochondrial", "fly.mitochondrial", and "yeast.mitochondrial"); `weights` vector of weights of length equal to the number of columns in `X` (defaults to unweighted); `outgroup` outgroup if outgroup rooting of the estimated tree is desired; and `cleanup` remove PHYLIP input & output files after the analysis is completed (defaults to `cleanup = TRUE`).

Rthreshml

*R interface for threshml*

---

## Description

This function is an R interface for threshml in the PHYLIP package (Felsenstein 1989, 2013). threshml fits the threshold model of Felsenstein (2005; 2012). Note that threshml is new & not in the currently released version of PHYLIP (as of December 2013). It can be downloaded from its web-page here: <http://evolution.gs.washington.edu/phylip/download/threshml/>. If not specifying path, the executable file for threshml (e.g., threshml.exe in Windows) should be placed in the folder containing all other executable files for PHYLIP (e.g., C:/Program Files/phylip=3.695/exe in Windows).

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 2013) should first be installed. More information about installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

## Usage

```
Rthreshml(tree, X, types=NULL, path=NULL, ...)
```

## Arguments

tree	object of class "phylo".
X	a <i>data.frame</i> of continuous valued or discrete character traits with rownames containing species names. Discrete & continuous characters can be supplied in any order. All discrete character traits must be two-state, but can be coded using any convention (i.e., 0, 1, "A", "B", etc.).
types	character vector containing the types (e.g., "discrete", "continuous"). If types are not supplied, Rthreshml will try to figure out which columns via <code>is.numeric</code> .
path	path to the executable containing threshml. If path = NULL, the R will search several commonly used directories for the correct executable file.
...	optional arguments to be passed to threshml. See details for more information.

## Details

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `burnin` burnin generations for the MCMC; `nchain` number of chains of the MCMC; `ngen` number of generations in each chain; `proposal` variance on the proposal distribution for the MCMC; `lrtest` logical value indicating whether to conduct a likelihood-ratio test of the hypothesis that some correlations are zero (does not appear to work in the present version); and `cleanup` remove PHYLIP input/output files after the analysis is completed (defaults to `cleanup = TRUE`).

**Value**

This function returns a list containing the results from threshml.

Rtreedist

*R interface for treedist*

---

**Description**

This function is an R interface for treedist in the PHYLIP package (Felsenstein 2013). treedist can be used to compute the distance between trees by two different methods.

**Usage**

```
Rtreedist(trees, method=c("branch.score", "symmetric"), path=NULL, ...)
```

**Arguments**

- |        |   |
|--------|---|
| trees  | an object of class "multiPhylo". (Or, under rare circumstances, an object of class "phylo". See below.)   |
| method | method to compute the distance between trees. method="branch.score" is the branch score method of Kuhner & Felsenstein (1994). method="symmetric" is the symmetric distance or Robinson-Foulds distance (Bourque 1978; Robinson & Foulds 1981). |
| path   | path to the directory containing the executable treedist. If path = NULL, the R will search several commonly used directories for the correct executable file.  |
| ...    | optional arguments to be passed to treedist. See details for more information.  |

## Details

Optional arguments include the following: `quiet` suppress some output to R console (defaults to `quiet = FALSE`); `trees2` object of class "multiPhylo" or "phylo" - if two sets of trees are to be compared; `rooted` logical value indicating whether trees should be treated as rooted (defaults to `rooted = FALSE`); `distances` argument telling treedist which distances to compute - could be "all" (all pairwise in trees), "all.1to2" (all in trees by all in trees2), "adjacent" (adjacent species in trees only), and "corresponding" (all corresponding trees in trees and trees2); and `cleanup` remove PHYLIP input & output files after the analysis is completed (defaults to `cleanup = TRUE`).

More information about the treedist program in PHYLIP can be found here <http://evolution.genetics.washington.edu/phylip/doc/treedist.html>.

Obviously, use of any of the functions of this package requires that PHYLIP (Felsenstein 1989, 2013) should first be installed. Instructions for installing PHYLIP can be found on the PHYLIP webpage: <http://evolution.genetics.washington.edu/phylip.html>.

## Value

This function returns a matrix of pairwise distances for `distances = "all"` and `distances = "all.1to2"`, or a named vector for `distances = "adjacent"` and `distances = "corresponding"`.

setupOSX*Help set up PHYLIP in Mac OS X*

---

**Description**

This function attempts to help set up PHYLIP on a Mac OS X machine.

**Usage**

```
setupOSX (path=NULL)
```

**Arguments**

path	path to the folder containing the PHYLIP package. If path = NULL, the R will search several commonly used directories.
------	--

**Details**

This function can be used to help set up PHYLIP (<http://evolution.genetics.washington.edu/phylip.html>) following the special instructions found [here](http://evolution.genetics.washington.edu/phylip/install.html): <http://evolution.genetics.washington.edu/phylip/install.html>. setupOSX should only be run once - when PHYLIP is first installed.
